Short Bio

My background in inorganic chemistry is enriched by years of interdisciplinary work in physics, oncology, bio- and nano-chemistry.

My efforts are focused on the establishment of non-invasive combined treatments for primary carcinoma and metastasis by exploiting hybrid nanotechnologies. My research interests comprise nanomedicine, nanotoxicology, chemoradiotherapy, photothermal conversion, drug delivery, photoacoustic imaging and alternative biomodels development. My main contribution to the oncological research has been the introduction of the ultrasmall-in-nano approach for the design of non-persistent plasmonic nanotherapeutics. Within my approach, I have released a family of plasmonic and biodegradable nano-architectures for the concurrent photo/chemo- or chemo/radio-treatment of both HPV-negative and HPV-positive oral neoplasms. Part of the generated IP have led to the filing of two international patents extended to EU, US and CN. Beyond the materials side, I became increasingly active in the development and standardization of advanced biomodels of neoplasms. Indeed, during my work on nanomaterials, I recognized the lack of bridging cancer models in preclinical research. For that reason, I have established a facility for the production and employment of alternative *in vivo* models that supports the translation of the most promising emergent treatments for some malignancies.
